Problem 1 (26.6). Let $s(x) = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \cdots$ and $c(x) = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots$ for $x \in \mathbb{R}$.

- (a) Prove s' = c and c' = -s.
- (b) Prove $(s^2 + c^2)' = 0$.
- (c) Prove $s^2 + c^2 = 1$.

Actually, $s(x) = \sin x$ and $c(x) = \cos x$, but you do **not** need these facts.

Solution 1. (a) (a) *Proof.* For $x \in \mathbb{R}$:

$$s(x) = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots$$
 (1)

$$c(x) = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \dots$$
 (2)

$$\lim_{t \to x} \phi(t) = \lim_{t \to x} \frac{f(t) - f(x)}{t - x} \tag{3}$$

$$s(x) = \sum_{n=0}^{\infty} \frac{x^{2n+1}(-1)^n}{(2n+1)!}!$$
 (4)

$$=\sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+1}}{(2n+1)!} \tag{5}$$

$$c(x) = \sum_{n=0}^{\infty} \frac{(-1)^n x^{(2x)}}{(2n)!}$$
 (6)

$$s'(x) = \sum_{n=0}^{\infty} \frac{(-1)^n (2n+1)x^{2n}}{(2n+1)!}$$
 (7)

$$=\frac{(-1)^n x^{2n}}{(2n)!} \tag{8}$$

$$=c(x) \tag{9}$$

(b) Proof.

$$c(x) = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n}}{(2n)!}$$
 (10)

$$c'(x) = \sum_{n=0}^{\infty} \frac{(-1)^n (2n) x^{2n-1}}{(2n)!}$$
 (11)

$$=\frac{(-1)^n x^{2n-1}}{(2n-1)!}\tag{12}$$

$$=\sum_{n=1}^{\infty} \frac{(-1)^{n+1} x^{2n-1}}{(2n-1)!}$$
 (13)

$$= -s(x) \tag{14}$$

(b) Proof.

$$(s^2 + c^2)' = 0 (15)$$

$$= \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k+1}}{(2k+1)!} + \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k}}{(2k)!}$$
 (16)

$$= \sum_{k=0}^{\infty} \left(\frac{(-1)^k x^{2k+1}}{(2k+1)!} + \frac{(-1)^k x^{2k}}{(2k)!} \right)$$
 (17)

$$=0 (18)$$

(c) todo

Problem 2 (33.3). A function f on [a,b] is called a *step function* if there exists a partition

$$P = \{ a = u_0 < u_1 < \dots < u_m = b \}$$
 (19)

of [a, b] —not $P = \{a = u_0 < u_1 < \dots < c_m = b\}$, as stated in the textbook— such that f is constant on each interval (u_{j-1}, u_j) , say $f(x) = c_j$ for x in (u_{j-1}, u_j) .

(a) Show that a step function f is integrable and evaluate $\int_a^b f$.

Solution 2. Proof. If f is constant on every interval, then $M_i = m_i$. Then, f is monotone and bounded on (u_{j-1}, u_j) , (in fact it is constant from (u_{j-1}, u_j)), so therefore it is uniformly continuous, which implies that there exists a continuous extension to the closed set $[u_{j-1}, u_j]$. Invoking Theorem (3.38) from Ross (Piecewise Monotone), we show that $f \in \mathcal{R}$.

Problem 3 (33.7). Let f be a bounded function on [a, b], so that there exists B > 0 such that $|f(x)| \leq B$ for all $x \in [a, b]$.

(a) Show

$$U(f^2, P) - L(f^2, P) \le 2B[U(f, P) - L(f, P)]$$

for all partitions *P* of [*a, b*]. *hint*: $f(x)^2 - f(y)^2 = [f(x) + f(y)] \cdot [f(x) - f(y)]$.

(b) Show that if f is integrable on [a, b], then f^2 also is integrable on [a, b].

Solution 3. Proof. f is a bounded function on [a, b], so there exists B > 0 s.t. $|f(x)| \le B$ for all $x \in [a, b]$.

$$u(f^2, p) = \sum_{i=1}^{\infty} M_i^2 \Delta x_i \tag{20}$$

$$=M_i^2 = \sup f(x)^2 \tag{21}$$

$$=\sum_{i=1}^{n} \left(M_i^2 - m_i^2\right) \Delta x_i \tag{22}$$

$$= \sum_{i=1}^{n} (M_{i+m_i}) (M_i - m_i) \Delta x_i$$
 (23)

$$\leq \sum_{i=1}^{n} 2B \left(M_i - m_i \right) \Delta x_i \tag{24}$$

$$=2B\sum_{i=1}^{\infty} (M_i - m_i) \Delta x_i \tag{25}$$

$$=2B\left(U(f,p)-L(f,p)\right) \tag{26}$$

Problem 4 (34.2). Calculate

(a) $\lim_{h\to 0} \frac{1}{h} \int_3^{3+h} e^{t^2} dt$.

Solution 4. Proof.

$$\int_{3}^{3+h} e^{t^2} \, \mathrm{d}t \tag{27}$$

$$= \lim_{h \to 0} \frac{F(3+h) - F(3)}{h} \tag{28}$$

(29)

By FTC I,

$$F'(3) = e^9 (30)$$

Problem 5 (34.5). Let f be a continuous function on \mathbb{R} and define

$$F(x) = \int_{x-1}^{x+1} f(t) dt \quad \text{for } x \in \mathbb{R}.$$
 (31)

Show F is differentiable on \mathbb{R} and compute F'.

Solution 5. Proof.

$$F(x) = \int_{x}^{0} f(t) dt + \int_{0}^{x+1} f(t) dt$$
 (32)

$$= -\int_0^{x-1} f(t) dt + \int_0^{x+1} f(t) dt$$
 (33)

(34)

By FTC II, we get:

$$F'(x_0) = f(x_0 + 1) - f(x_0 - 1)$$
(35)

Problem 6. A. [Bonus problem] Suppose f is a continuous non-negative function on [a, b], with

$$M = \max_{x \in [a,b]} f(x). \tag{36}$$

For $n \in \mathbb{N}$, let

$$M_n = \left(\int_a^b f^n \, dt\right)^{1/n}.\tag{37}$$

Prove that $\lim M_n = M$.

Solution 6. Proof.

$$\left(\int_{a}^{b} f^{n}\right)^{\frac{1}{n}} \le ((b-a)(M^{n}))^{\frac{1}{n}} \tag{38}$$

$$= \lim_{n \to \infty} \underbrace{(b-a)^{\frac{1}{n}}}_{1} M = M \tag{39}$$
